Worksheet-1 in R

Worksheet for R Programming

Instructions:

- Use RStudio or the RStudio Cloud accomplish this worksheet. + Save the R script as RWorksheet_lastname#1. R. Done
- Create your own GitHub repository and push the R script as well as this pdf worksheet to your own repo.

Accomplish this worksheet by answering the questions being asked and writing the code manually.

Using functions:

seq(), assign(), min(), max(), c(), sort(), sum(), filter()

- 1. Set up a vector named age, consisting of 34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41.
- a. How many data points?Answer: 34 Data Points
- b. Write the R code and its output.

```
Answer:
```

```
age <- c(34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41)
```

> age

```

It displayed the values of age and zero (0) in the middle then followed by the values of age again.

4. Sort the values for age. Write the R code and its output.

```
Answer: sort(age)

5. Find the minimum and maximum value for age. Write the R code and its output.

```
Answer: > min(age)
[1] 17
> max(age)
[1] 57
```

- 6. Set up a vector named data, consisting of 2.4, 2.8, 2.1, 2.5, 2.4, 2.2, 2.5, 2.3,
- 2.5, 2.3, 2.4, and 2.7.
- a. How many data points?

Answer: 12 Data Points

b. Write the R code and its output.

```
Answer: > data <- c( 2.4, 2.8, 2.1, 2.5, 2.4, 2.2, 2.5, 2.3, + 2.5, 2.3, 2.4)  
> data [1] 2.4 2.8 2.1 2.5 2.4 2.2 2.5 2.3 2.5 2.3 2.4
```

7. Generates a new vector for data where you double every value of the data. | What happen to the data?

- 8. Generate a sequence for the following scenario:
- 8.1 Integers from 1 to 100.

```
Answer: > one_onehundred <- seq(1:100)

> one_onehundred

c. For 8.5 find only maximum data points until 10.

Answer: maximum data points until 10 is 10

9. *Print a vector with the integers between 1 and 100 that are not divisible by 3, 5 and 7 using filter option.

```
filter(function(i) { all(i \%\% c(3,5,7)!= 0) }, seq(100))
```

Write the R code and its output.

```
Answer: > Filter(function(i) { all(i %% c(3,5,7) != 0) }, seq(100))

11. List all the natural numbers below 25 that are multiples of 3 or 5.

Find the sum of these multiples.

```
Answer: > data.frame(sum((1 : 25)[((1 : 25)%%3 == 0) | ((1:25)%%5 == 0)]))

a. How many data points from 10 to 11?

Answer: 100 Data points in 10

1 Data point in 11

Total of 101 Data points

b. Write the R code and its output from 10 and 11.

Answer:

12. Statements can be grouped together using braces '{' and '}'. A group of statements is sometimes called a block. Single statements are evaluated when a new line is typed at the end of the syntactically complete statement. Blocks are not evaluated until a new line is entered after the closing brace.

Enter this statement:

```
\{x < -0 + x + 5 + \}
```

Describe the output.

Answer: $> \{x < 0 + x + 5 + \}$

Error: unexpected '}' in " $\{x < -0 + x + 5 + \}$ "

It says error due to closing bracket, although I believe that it is due for it having an undefined variable such as' x' and a '+'. That is why the code didn't work.

13. *Set up a vector named score, consisting of 72, 86, 92, 63, 88, 89, 91, 92, 75,

75 and 77. To access individual elements of an atomic vector, one generally uses the x[i] construction.

Find x[2] and x[3]. Write the R code and its output.

- 14. *Create a vector a = c(1,2,NA,4,NA,6,7).
- a. Change the NA to 999 using the codes print(a,na.print="-999").

```
Answer:  > a = c(1,2,NA,4,NA,6,7) 
 > print(a,na.print="-999") 
[1] 1 2-999 4-999 6 7
```

b. Write the R code and its output. Describe the output.

```
Answer:> a = c(1,2,NA,4,NA,6,7)
> print(a,na.print="-999")
[1] 1 2-999 4-999 6 7
```

I created a vector named a with the content of (1,2,NA,4,NA,6,7), I then write a code that will assign a new value to be displayed in NA, which is -999.

```
15. A special type of function calls can appear on the left hand side of the assignment
operator as in > class(x) <- "foo".
Follow the codes below:
name = readline(prompt="Input your name: ")
age = readline(prompt="Input your age: ")
print(paste("My name is",name, "and I am",age ,"years old."))
print(R.version.string)
What is the output of the above code?
Answer: > name = readline(prompt="Input your name: ")
       Input your name: Joseph Bennett P. Dairo
       > age = readline(prompt="Input your age: ")
       Input your age: 19
       > print(paste("My name is",name, "and I am",age ,"years old."))
       [1] "My name is Joseph Bennett P. Dairo and I am 19 years old."
       > print(R.version.string)
       [1] "R version 4.2.1 (2022-06-23 ucrt)"
```
